

Attacking WiFi networks with traffic injection

Why open and WEP 802.11 networks really suck

Cédric BLANCHER

RECON - Montréal - Canada
17-19 June 2005
<http://recon.cx/>

Agenda

- 1 Introduction
- 2 Really quick 802.11 101
 - WiFi injection basics
- 3 Attacking WiFi networks
 - Where's the police - Managing management traffic
 - In the darkness bind them - rogue APs
 - Breaking the shell - WEP cracking
 - Let me free - Bypassing captive portals
 - All naked - Attacking stations
- 4 WPA, WPA2 and 802.11i
- 5 Conclusion

Spam...

<commercial>

I work for EADS Corporate Research Center, IT Security dpt

If you happen to need a A380 or Tigre helicopter, see me after my talk :)

</commercial>

Plan

- 1 Introduction
- 2 Really quick 802.11 101
 - WiFi injection basics
- 3 Attacking WiFi networks
 - Where's the police - Managing management traffic
 - In the darkness bind them - rogue APs
 - Breaking the shell - WEP cracking
 - Let me free - Bypassing captive portals
 - All naked - Attacking stations
- 4 WPA, WPA2 and 802.11i
- 5 Conclusion

Introduction

We already know 802.11 networks are weak

- Open networks are prone to any well-known LAN perimeter attack
- WEP is vulnerable

So why this talk ?

Introduction

This talk is "people never learn" story

Goals

- Understand that WiFi open networks are unsecure for users
- Understand that WEP really sucks and should not be used anymore
- Understand that there's no salvation outside WPA/WPA2

Maybe make people learn something, at least (in case they don't know yet)

Introduction

Traffic injection has changed things

- Increase DoS capabilities
- Dramatically decreased WEP cracking achievement time
- Allows station traffic attacking
- Allows station attacking

But still...

- Most ISPs selling wireless/router/modem based access only provide WEP support
- Most commercial hotspots are still open networks...

Plan

- 1 Introduction
- 2 Really quick 802.11 101
 - WiFi injection basics
- 3 Attacking WiFi networks
 - Where's the police - Managing management traffic
 - In the darkness bind them - rogue APs
 - Breaking the shell - WEP cracking
 - Let me free - Bypassing captive portals
 - All naked - Attacking stations
- 4 WPA, WPA2 and 802.11i
- 5 Conclusion

802.11 basics

802.11 is a wireless communication IEEE standard commercially known as WiFi

- CSMA/CA based
- Infrastructure vs. Ad-hoc
- Association concept
- Management vs. data traffic

802.11 "early" security

WiFi protection scheme is WEP (Wired Equivalent Privacy)

- Authentication through challenge/response
- Confidentiality with RC4 cipher using 24bits IV plus fixed key
- Integrity with CRC32 on cleartext payload

- 1 Introduction
- 2 Really quick 802.11 101
 - WiFi injection basics
- 3 Attacking WiFi networks
 - Where's the police - Managing management traffic
 - In the darkness bind them - rogue APs
 - Breaking the shell - WEP cracking
 - Let me free - Bypassing captive portals
 - All naked - Attacking stations
- 4 WPA, WPA2 and 802.11i
- 5 Conclusion

Arbitrary frames injection

Quite old but non common fonctionnality

- Needs appropriate firmware
- Needs appropriate driver
- Needs appropriate library/software

Some tools exist¹, but mainly focus on management traffic
Hostap² based stuff, but Prism2 firmwares are somehow reluctant

¹e.g. <http://sourceforge.net/projects/airjack/>

²<http://hostap.epitest.fi/>

Toolkit

Proper adapter and driver

- Hostap, but limited to some kind of frames
- Atheros/Madwifi³, patched for traffic injection
- Intersil Prism54⁴, development SVN snapshot

Atheros remains the most popular chipset due to a documented HAL

³<http://madwifi.sf.net/>

⁴<http://prism54.org/>

Traffic injection 101

To inject traffic

- 1 Load driver and activate adapter
- 2 Put adapter into monitor mode (real 802.11 mode)
- 3 Set appropriate channel
- 4 Open RAW socket on interface
- 5 Use your socket

Still, you need to implement a 802.11/MAC/IP stack over your socket and/or good libs and tools so you can communicate

Plan

- 1 Introduction
- 2 Really quick 802.11 101
 - WiFi injection basics
- 3 Attacking WiFi networks
 - Where's the police - Managing management traffic
 - In the darkness bind them - rogue APs
 - Breaking the shell - WEP cracking
 - Let me free - Bypassing captive portals
 - All naked - Attacking stations
- 4 WPA, WPA2 and 802.11i
- 5 Conclusion

- 1 Introduction

 - WiFi injection basics
- 3 **Attacking WiFi networks**
 - **Where's the police - Managing management traffic**
 - In the darkness bind them - rogue APs
 - Breaking the shell - WEP cracking
 - Let me free - Bypassing captive portals
 - All naked - Attacking stations
- 4 WPA, WPA2 and 802.11i
- 5 Conclusion

Management traffic

Suppose to control DSS state, such as associations...

Management traffic is a regulation traffic that is completely unprotected

Management traffic is extremely prone to spoofing

Tampering management traffic

You alter DSS current state by tampering management traffic

- Reject association requests
- Inject disassociation frame
- Inject fake associations
- Wake up devices in sleep mode
- Etc.

Mainly DoSes...

Management traffic generation

Management traffic is easy to generate and inject

See Scapy⁵ packets classes

- Dot11
- Dot11Disas
- Dot11AssoResp
- Dot11ReassoResp
- Dot11Deauth
- etc.

See Scapy in action :

http://www.secdev.org/conf/scapy_csw05.pdf

⁵<http://www.secdev.org/projects/scapy/>

- 1 Introduction

 - Breaking the shell - WEP cracking
 - Let me free - Bypassing captive portals
 - All naked - Attacking stations
- 4 WPA, WPA2 and 802.11i
- 5 Conclusion

Building AP from scratch

For AP mode, you need to inject

- Beacon frames
- Associations requests answers
- Management traffic
- Data frames acking

Rogue APs

If you can be an AP, you can also be a fake one...

- Cheap solution for traffic redirection
- Cheap attack against automatic "WiFi network managers"^a

Rogue AP is the poor man attack that works so well

^a<http://theta44.org/main.html>

- 1 Introduction
- 2 Really quick 802.11 101
 - WiFi injection basics
- 3 Attacking WiFi networks
 - Where's the police - Managing management traffic
 - In the darkness bind them - rogue APs
 - **Breaking the shell - WEP cracking**
 - Let me free - Bypassing captive portals
 - All naked - Attacking stations
- 4 WPA, WPA2 and 802.11i
- 5 Conclusion

WEP breaking basics

WEP is RC4 based, which is XOR based

- Cleartext attacks (e.g. authentication challenge)
- PRGA/IV couple table construction
- Fluhrer, Mantin and Shamir attack based on first bytes of key being weak (weak IVs)
- Korek optimization of FMS attack based on solved cases

Last attacks need traffic gathering

Modified packet injection

Let C be our cleartext message and Mod a C slight modification

Let $C' = C \oplus Mod$

Some maths

$$P = WEP(C + ICV(C))$$

$$= (C + ICV(C)) \oplus RC4(IV + K)$$

$$P' = (C' + ICV(C')) \oplus RC4(IV + K)$$

$$= (C + ICV(C)) \oplus RC4(IV + K) \oplus (Mod + ICV(Mod))$$

$$= P \oplus (Mod + ICV(Mod))$$

This means you can inject arbitrary WEP frames and have them decrypted...

Consequences

We can inject arbitrary traffic through WEP without key knowledge

- Launch oracle based attacks
- Stimulate network in order to create traffic (e.g. aireplay)

Full WEP cracking is no more relying on passive listening

Korek Chopchop attack

Korek published⁶ a one packet decrypting attack based on oracle

- 1 Grab a packet
- 2 Modify one byte
- 3 Reinject
- 4 Deduce byte value

Easy isn't it ?

⁶<http://www.netstumbler.org/showthread.php?t=12489>

Korek-Devine WEP cracking

Using Chopchop and some FMS optimizations from Korek, Christophe Devine released Aircrack⁷

- 1 Use Chopchop to spot an answered ARP request
- 2 Inject ARP request again and again
- 3 Stimulate traffic and unique IV collection
- 4 Terminate WEP key cracking within few seconds

Full WEP cracking is now question of minutes or so

And aircrack still can be optimized...

⁷<http://www.cr0.net:8040/code/network/aircrack/>

- 1 Introduction
- 2 Really quick 802.11 101
 - WiFi injection basics
- 3 **Attacking WiFi networks**

 - In the darkness bind them - rogue APs
 - Breaking the shell - WEP cracking
 - **Let me free - Bypassing captive portals**
 - All naked - Attacking stations
- 4 WPA, WPA2 and 802.11i
- 5 Conclusion

Commercial WiFi hotspots

Commercial public Internet access

- Captive portal based system
- Authentication to billing system through web portal
- Authorization for Internet access
- Authorization tracking

It would be nice to be free... For free!

MAC based authorization tracking

Authorized clients are identified by their MAC address

- MAC address is easy to spoof
- No MAC layer conflict on WiFi network
- Just need a different IP

Recipe : spoof an authorized MAC address, get an IP and surf

IP based authorization tracking

Authorized clients are identified by their IP address

- IP address are just a little more tricky to spoof
- ARP cache poisoning helps redirecting traffic
- Traffic redirection allows IP spoofing

Recipe : ARP poison gateway for authorized IP, spoof and surf

MAC+IP addresses based authorization tracking

The smart way fo tracking people ?

- Previous technic won't help because of MAC address checking
- Hint : IP layer does not care about MAC layer
- ARP cache poisoning and IP spoofing
- Send traffic with spoofed MAC address

Recipe : Same as before, plus MAC spoofing, then surf

Configuration based tricks

Some gateways are misconfigured

- HTTP proxy left open on gateway
- ESTABLISHED,RELATED -j ACCEPT prevents connections drop when authorization expires on Linux based systems
- Administration network on the same VLAN, accessible through WiFi
- Etc.

Misconfigurations tend to be unusual

- 1 Introduction
- 2 Really quick 802.11 101
 - WiFi injection basics
- 3 **Attacking WiFi networks**
 - Where's the police - Managing management traffic
 - In the darkness bind them - rogue APs
 - Breaking the shell - WEP cracking
 - Let me free - Bypassing captive portals
 - **All naked - Attacking stations**
- 4 WPA, WPA2 and 802.11i
- 5 Conclusion

What about associated stations ?

Associated stations are almost naked

- LAN attacks (ARP, DHCP, DNS, etc.)
- Traffic interception tampering
- Direct station attack

Manufacturers provides so called "solutions",
mainly station to station communication
prevention systems (e.g. Cisco PPSF)

Traffic tampering

WiFi communication are just opened on the air

- Listen to WiFi traffic
- Identify given requests
- Inject your own answers
- Clap clap, you've done airpwn⁸ like tool

Think of just injecting nasty things in HTTP traffic just in case someone would dare use MSIE

⁸<http://www.evilscheme.org/defcon/>

Communication injection

Send traffic directly to station without AP authorization

- Allows PSPF bypass
- Allows communicating while AP out of reach
- Allows communication while AP refuses association

A smart of for reaching stations without being associated

Proof of concept : Wifitap

Needed a PoC for Cisco PSPF bypass and wrote Wifitap

- Written in Python⁹
- Relies on Scapy¹⁰
- Uses tuntap device and OS IP stack
- Use WiFi frame injection and sniffing

Wifitap allows communication with station despite AP restrictions

⁹<http://www.python.org/>

¹⁰<http://www.secdev.org/projects/scapy.html>

Wifitap in short

How Wifitap works

Sending traffic

- Read ethernet from tuntap
- Add 802.11 headers
- Add BSSID, From-DS and WEP
- Inject frame over WiFi

Receiving traffic

- Sniff 802.11 frame
- Remove WEP layer if needed
- Remove 802.11 headers
- Send ethernet through tuntap

Attacker does not need to be associated

Quick demo...

We Proudly R3wt

Download Wifitap at
<http://sid.rstack.org/code/wifitap.tgz>

More hotspot bypassing...

Hijacking a guy authorization is not very kind

- Use Wifitap to bypass PSPF
- Now you can send back his traffic to the poor victim

Now your victim and you are able to surf transparently

Plan

- 1 Introduction
- 2 Really quick 802.11 101
 - WiFi injection basics
- 3 Attacking WiFi networks
 - Where's the police - Managing management traffic
 - In the darkness bind them - rogue APs
 - Breaking the shell - WEP cracking
 - Let me free - Bypassing captive portals
 - All naked - Attacking stations
- 4 WPA, WPA2 and 802.11i
- 5 Conclusion

WPA

Transitional recommendation from WiFi Alliance extracted from IEEE work for infrastructure networks

- New authentication scheme based on PSK or 802.1x
- New key generation and scheduling scheme for keys
- New integrity check through Michael MIC with sequencing

Pretty solid solution that can prevent injection/replay

802.11i

Standard from IEEE for WiFi security

WPA2 is a recommendation from WiFi alliance based on 802.11i

- Authentication using 802.1x
- Ciphering using AES-CCMP
- Integrity check using CCMP MIC

Return to the roots and use of a real adapted ciphering solution

And then ?

WPA and WPA2 provide strong mechanisms

Some flaws on WPA

- Accelerated attack against PTK key (105bits vs. 128bits)
- WPA PSK bruteforce

Attack counter-measures can be used to trigger DoS

- Wild traffic replay
- Wild dumb traffic injection

Nothing will protect from layer 1 based DoS attacks (bandwidth reservation, jamming)

Plan

- 1 Introduction
- 2 Really quick 802.11 101
 - WiFi injection basics
- 3 Attacking WiFi networks
 - Where's the police - Managing management traffic
 - In the darkness bind them - rogue APs
 - Breaking the shell - WEP cracking
 - Let me free - Bypassing captive portals
 - All naked - Attacking stations
- 4 WPA, WPA2 and 802.11i
- 5 Conclusion

Conclusion

WiFi environnement are highly insecure and tough to secure
You just can't cope with amateur style protection...

Then...

- Don't use WEP anymore
- Dont' use open network for public access
- Migrate to WPA, then WPA2 as soon as possible

Rstack powered talk...
